**COMPARABLE COMMODITY STATISTICS OF
PRODUCTION, IMPORTS AND EXPORTS, AUSTRALIA : 1977-78
Goods Originating in Manufacturing Industries**

PREFACE

This publication is the second in this series which presents comparable Australian production, import and export commodity statistics of manufactured goods classified in accordance with the Australian Standard Commodity Classification (ASCC). The statistics and the classification in this publication relate to the year 1977-78.

The ASCC, and these publications which bring together the statistics compiled in accordance with it, facilitate comparative analysis of commodity flows in production, consumption and international trade. However, the ASCC which governs the commodity content of this publication, is still subject to considerable long term development and improvement, particularly in the direction of extending the range of commodities covered and improving the degree of comparability between equivalent production, import and export commodity items. Accordingly, as the ASCC is further developed and improved over time, so will the statistics compiled in accordance with it. In fact, a number of changes which are made in this issue represent significant improvements on the first issue of this publication (for the year 1975-76). An additional publication is being prepared for release later this year which will present comparable production and trade statistics of goods originating in the agriculture, forestry, fishing, hunting and mining industries for the year 1977-78.

EXPLANATORY NOTES

INTRODUCTION

This publication presents comparable Australian production, import and export commodity statistics of goods originating in manufacturing industries, classified in accordance with the *Australian Standard Commodity Classification (ASCC)*, (Catalogue No 1208.0). The statistics and the classification relate to the year 1977-78.

2. The statistics in this publication as well as the Australian Standard Commodity Classification (ASCC) are aimed at meeting a number of important needs for comparable production and overseas trade commodity statistics.

3. These needs relate mainly to the use of comparable commodity statistics by government and private organisations in applications such as analysis of the relationship between employment, industrial structure, and tariff provisions, studies of import competition and replacement, submissions to the Industries Assistance Commission, the estimation of market shares, the compilation of input-output tables (in situations where more specifically input-output oriented commodity statistics are not available) and the conduct of trade and tariff negotiations — e.g. within the framework of GATT (the General Agreement on Tariffs and Trade).

Present status and further development of the statistics

4. The 1977-78 edition of the ASCC, and the statistics compiled in accordance with it, go some way towards meeting the needs mentioned above.

5. However, the ASCC, which governs the commodity content of this publication, still requires considerable further long term development (which has already begun) to fully meet these needs. For example, the degree of comparability between equivalent production, import and export commodities as presented in the 1977-78 edition of the ASCC (and hence in this publication) is still rather approximate in a number of cases. Accordingly, continuing development of the ASCC will concentrate, amongst other aspects, on the development of more homogeneous and useful standard (ASCC) items of transportable goods.

6. As a result of this continuing development process, the 1977-78 edition of the ASCC already contains several improvements over the first (1975-76) edition. In the 1977-78 edition, the Classification has been expanded to cover commodities originating in the Agriculture, Forestry, Fishing, Hunting and Mining industries and a separate publication containing comparable Australian production, import and export commodity statistics of goods originating in these industries is expected to be issued later this year. Further, greater attention has been paid to creating standard (ASCC) items which only include commodities originating from a single industry class, and to presenting standard items under the headings of the industries in which they originate. The statistics in this publication thereby reflect these improvements.

Changes implemented in this edition of the publication

7. This year, for the first time, statistics of 'Imports Cleared for Home Consumption' and 'Duty Paid' have been included to enable users to arrive at more realistic approximations of market values for imported goods. In addition, statistics on total exports have been split into Australian produce and Re-exports to facilitate analysis.

8. Further, the 1977-78 edition of the ASCC and, hence, this publication, have been rebased on the revised, 1978, edition of the *Australian Standard Industrial Classification (ASIC)*, (1201.0). (The industry of origin categories in the 1975-76 edition of the ASCC (1208.0) and the publication *Comparable Commodity Statistics of Production, Imports and Exports, Australia: 1975-76* (1310.0) were based on industries in the 1969 Preliminary Edition of the ASIC (1201.0)).

9. The rebasing of the ASCC on the 1978 edition of the ASIC has given rise to the following kinds of changes:

- The industry of origin categories now reflect those in the 1978 edition of the ASIC.
- In several instances commodities and their statistics will now be shown under industry of origin categories differing from those in the 1975-76 editions of the ASCC manual and the publication of comparable commodity statistics. These changes reflect changes in ASIC industry definitions.
- The standard item codes in the ASCC and thus in this publication have been amended to agree with the new ASIC codes. (In addition the opportunity was taken to renumber standard items within industry of origin categories to facilitate future inclusions and deletions of items.)

ASCC categories

Industry of origin categories

10. The industry of origin categories in this publication are the broadest or most summary headings of the ASCC. They represent the industries in which the commodities, listed under them in the form of standard items, typically originate — i.e. the industries in which the commodities are mainly or typically produced. This method of ordering and presenting commodities reflects the 'industrial origin' structure of the ASCC.

11. As indicated above, the industry of origin categories in the ASCC, and in this publication, are now based on the industries in the 1978 edition of the ASIC.

12. It is important to note that in an industrial origin commodity classification such as the ASCC, each individual commodity item is shown only under one industry of origin heading — the industry in which the commodity typically originates.

13. In practice, of course, many commodities are produced not only by their 'typical' industry of origin but by other industries as well. An industry of origin commodity classification should not therefore be confused with a cross classification of commodities by industry of production. The latter would list, under each industry, all the commodities which are actually produced in the industry, so that an individual commodity would be shown under all the industries in which it is actually produced.

14. In most cases each ASCC industry of origin category is equivalent to an industry class in the ASIC. However, in some cases, two or more ASIC classes have been combined for purposes of the ASCC to form a special combined class, i.e. a single industry of origin category. This has been necessary where many standard (ASCC) items contain commodities originating in two or more ASIC classes.

15. The industry of origin categories are identified by 4-digit code numbers. Where an industry of origin category is equivalent to an industry class in the ASIC, the 4-digit code number in the ASCC and this publication is that of the ASIC class. Where an industry of origin category represents a combination of ASIC classes, a 4-digit code not used anywhere in the ASIC has been adopted. All instances of this kind are listed in the Appendix.

Standard items

16. Standard (ASCC) items, as contained in the ASCC manual, and according to which statistics are shown in this publication have been formed from detailed production, import and export items and represent the most detailed common groupings of production, import and export items.

17. Thus, standard item 2171.10, 'Molasses', has as its components: production item 102.75, Molasses, import item 061.50.00, Molasses, whether or not decolourised, and export item 061.50.00, Molasses. However, in a large number of cases standard (ASCC) items are more broadly defined so that each one covers a number of production, import and export commodity items. For example, standard item 3169.40, 'Flexible tubing and piping of base metal' has as its components the following items:

• Production items:

Flexible metal tubing (ferrous and non-ferrous):

- 469.11 — Covered or lined
- 469.13 — Not covered or lined

• AICC items:

Flexible tubing and piping, of base metal:

- 698.82.01 — Interlock type
- 698.82.02 — Square-lock type
- 698.82.03 — Corrugated (convoluted) type
- Bellows, expansion joint.
- 698.82.07 — — Not exceeding 152mm internal diameter
- 698.82.11 — — Other
- 698.82.19 — Other (including wholly or essentially of spirally wound wire)

• AECC item:

698.82.00 Flexible tubing and piping of base metal

18. It should be noted in both examples above that the standard (ASCC) items represent the most detailed common grouping of production, import and export items — i.e. both are the most detailed items for which comparable statistics of production, imports and exports can be derived.

19. Standard items representing the most detailed common groupings of production, import and export items are identified by a 6-digit code (both in the ASCC and in this publication) with the first four digits identifying the industry of origin.

20. In many instances, however, more detailed comparability between either production and import items or production and export items has been possible within a 6-digit standard item. In these cases further standard items have been formed representing the more detailed categories. These standard items are identified by an 8-digit code (the first six digits of which represent the code number of the 6-digit item).

21. More detailed information regarding the production, import and export items included in standard items can be obtained from the ASCC manual (1208.0). Statistics of individual production and trade commodity items included in a standard item may be obtained from the ABS publications *Manufacturing Commodities, Principal Articles Produced* (8303.0), *Overseas Trade — Part 1: Exports and Imports* (5409.0) and *Imports Cleared for Home Consumption — Part 1* (5412.0), *Part 2* (5413.0).

Production, import and export statistics and their valuation

22. The data for production, imports and exports shown in this publication for each standard item relate to values only. (Quantity data are not included either because quantity details are not, or sometimes cannot be, compiled for all the production, import or export items of which the standard items are composed or because different units of quantity are used or are applicable to different component items of the standard items.)

Production Statistics

23. Production statistics in this publication relate to the values of sales and/or transfers out of commodities manufactured in Australia, as reported in the 1977-78 Census of Manufacturing Establishments, and may represent either sales and/or transfers out of commodities produced during the year or sale and/or transfers out of commodities withdrawn from stocks. Thus these values of sales and transfers out are not equivalent to the value of all commodities manufactured during the year by the establishments covered in that Census, since this would require adjustments for net changes in stocks, which are not available in commodity detail.

24. Sales of commodities by single establishment

enterprises employing less than four persons are excluded from this publication since they are excluded from the commodity sales statistics compiled from the Census of Manufacturing Establishments. However, they contribute only marginally to statistical aggregates.

Basis of valuation of sales and transfers out

25. Sales relate to transactions between different enterprises (e.g. companies) and the reported sales values exclude excise and sales tax. Transfers out relate to transactions between different establishments of the same enterprise (e.g. company). Goods transferred out from one establishment to other establishments of the same enterprise are valued, for statistical purposes, at commercial selling prices. Both sales and transfers out relate only to commodities produced by the reporting establishment or to commodities produced for it on commission from materials supplied by it. Sales and transfers out of merchanted goods are excluded.

Import, Imports Cleared for Home Consumption, Duty Paid and Export Statistics

26. The statistics of 'imports' presented in this publication are recorded on a 'general trade' basis i.e. imports comprise goods entered directly for domestic consumption together with goods imported into Customs warehouses.

27. The statistics of 'imports cleared for home consumption' presented in this publication are recorded on a 'special trade' basis, i.e. they comprise goods entered directly for domestic consumption together with goods cleared into the domestic market from Customs warehouses. Both sets of statistics are presented in this publication so that users may utilise whichever series meets their requirements for statistical analysis.

28. Statistics of 'exports' are also presented in terms of a 'general trade' basis i.e. total exports include both Australian produce and Re-exports. Once again, to facilitate analysis, statistics of exports of Australian produce and Re-exports are provided separately.

Basis of valuation of imports and exports

29. *Exports.* Goods sold to overseas buyers before export are valued at the free-on-board (f.o.b.) Australian port of shipment equivalent of the actual price paid to the exporter. Goods shipped on consignment are valued at the f.o.b. Australian port of shipment equivalent of the current price offering for similar goods of Australian origin in the principal markets of the country to which they are despatched for sale. The value of outside packages is included.

30. *Imports.* The recorded value is the value for duty for Customs purposes (VFD). On 1 July 1976, Australia adopted the internationally recognised Brussels Definition of Value (BDV) on a f.o.b. basis (i.e. charges and expenses involved in delivering the goods from the place of exportation to the place of introduction in Australia, are excluded). The value for duty is based on the normal price i.e. the price the goods

would fetch at the time when duty becomes payable on a sale in the open market between a buyer and a seller independent of each other. In practice, the basis for valuation is generally taken to be the invoice price subject to certain safeguards and adjustments where necessary. It is estimated that if the previous basis of valuation had continued, the value of total imports would have been about 2% higher than the recorded values on the new basis. For details of the method of valuation used prior to 1 July 1976, refer to the 1975-76 edition of this publication.

Treatment of confidential data

31. If the production, or import or export component value of a standard item is confidential, the standard item has been combined, where possible, with another standard item or items. (Every effort has been made to combine standard items covering similar or related commodities. E.g. standard item 2176.05, 'Coffee, roasted' has been combined with standard item 2176.10, 'Coffee extracts, essences, concentrates and similar preparations of coffee'.) Where, however, it was not suitable or practical to combine standard items, the standard item has been published with a footnote in the column of the confidential component indicating that the data is not available for publication. E.g. standard item 2123.05, 'Processed cheese (including pastes and spreads)'.

32. Where a significant percentage of the total value of the production, import or export component of a standard item is confidential, no value is shown in the relevant column. Instead, a footnote is inserted in the column to indicate that some commodity item/s is/are confidential, and that the value of the non-confidential element is included in the footnote — e.g. standard item 3485.45, 'Cricket gloves'.

33. Where, however, the confidential items in the production, import or export component of a standard item do not account for a significant percentage of the total value, the value of the non-confidential element is shown in the appropriate column and a footnote is inserted against the figure to indicate that it excludes data for the confidential item/s — e.g. standard item 2342.50, 'Discontinuous or waste man-made fibres, carded, combed or otherwise prepared for spinning'.

Footnotes

34. Four 'common' footnotes (see below) are used to identify factors which occur frequently and which could affect the statistics and their comparability. They are:

- (i) Footnote (a) which is used against the production value of a 6-digit standard item where the production statistic is deficient. The total production value may be deficient because in one or more of the related 8-digit standard items some production items may be confidential or statistics may not be collected for some of the commodities. For example, in standard item 2125.15, the production component of \$66.5m is deficient by the value of production statistics for dried full cream milk in block

form, relevant to standard item 2125.15.05, because statistics are not collected specifically for these commodities and by the value of the production item of standard item 2125.15.10 because it is confidential. The nature of the deficiencies is explained in specific footnotes in the relevant 8-digit standard items. Where the deficiencies account for a significant percentage of the total production value, to avoid possible confusion no figure is shown in the production column because in these situations, valid comparisons with the trade statistics would not be possible. However, for the information of the user, the value of the available and non-confidential component of the standard item is contained in the body of the footnote (e.g. standard item 3169.45).

- (ii) Footnote (b) — the 'complete production gap' footnote. This footnote is used in the production column to indicate that production statistics are not collected specifically for any of the commodities covered by the standard item, due to gaps in the coverage of "specified" production items. ('Partial production gap' situations — i.e. where production statistics are not collected specifically for some of the commodities covered by the standard item, are covered by specific footnotes.)
- (iii) Footnote (c) which is used in one of the trade columns of an 8-digit standard item to indicate that data is available only at the broader 6-digit item level. For example, in standard item 2345.05 where more detailed categories are provided between production and imports at the 8-digit level, the footnote (c) is shown in the export column of 2345.05.05 and 2345.05.10 to indicate that the comparable export statistics for these commodities are available at the 6-digit level only — i.e. for standard item 2345.05.
- (iv) Footnote (d) — the 'duplication' footnote, which is shown against the title of a standard item, informs users of possible duplication in the standard item and advises them to exercise caution when comparing details of production and trade. A standard item could involve duplication in that, for example, the parts of a commodity could be covered by its production and import statistics and the complete commodity made from the parts could also be covered by production statistics of the standard item (e.g. standard item 2342.50).

35. Apart from these 'common' footnotes, other specific footnotes are used in this publication.

36. All the various factors which could affect the content and comparability of the statistics have not been footnoted — provided generally valid comparison of the data has not been jeopardised. For example, the statistics in some standard items have not been footnoted to indicate that they include data of some commodities which belong to some other standard item — i.e. the 'surplus' footnote referred to in the ASCC manual. This was done because these

'surplus' and their corresponding 'deficiency' situations are numerous and not considered significant enough to affect valid comparisons between the data.

37. For a complete record of the various factors affecting the content and comparability of commodities as contained in the standard items, reference should be made to the ASCC manual (1208.0).

Factors which inhibit or limit the comparability of the data

38. There are various factors which could affect the comparability of commodity statistics of production, imports and exports compiled according to the ASCC. These are identified below and are intended to provide a qualitative assessment of the problems that could be encountered. The quantitative impact of some of them may only be marginal.

The factors which could affect comparability can generally be considered to fall into the following broad categories:

- Classification problems.
- Other problems.

Classification problems

39. Problems in this category arise due to the inherent differences between the production and overseas trade commodity classifications. Due to differences in the definitions of commodities in the three commodity classifications on which the ASCC is based, complete comparability between equivalent production, import and export items has not been established in a large number of instances. The partial, incomplete or very broad comparability achieved in these instances is, naturally, reflected in the statistics.

Other problems

40. This second category of problems involves issues which cannot usually be solved by improving the ASCC or its related classifications. In the main, these problems include the following:

- **VALUATION.** One of the main problems in comparing data from the three sources is the differences between the methods of valuation, as described above, particularly in connection with transport costs, excise costs, merchants' margins, etc. For example, export values may be greater than production values because of the addition of packaging, insurance and transport costs to the point of export and because of the exporters' trade margin.
- **TIME OF RECORDING.** Producers' sales and transfers out are recorded in businesses' accounts as occurring at the time when ownership changes. Import and export statistics relate to the time of movement of goods across the Customs frontier of the country and this does not necessarily coincide with the time at which ownership of the goods changed. Thus, sales in one year to overseas buyers may be recorded as exports in a different year. Similarly, the

recording of purchases may be in one period and the corresponding imports in a different period.

- **DUPLICATION.** Some standard items contain duplication in that the production and import statistics cover certain components while the production statistics could also cover the complete goods made from the components. In this type of situation care should be exercised when comparing statistics from the three series.
- **LIMITATIONS IN SCOPE OR COVERAGE OF STATISTICAL COLLECTIONS.** Problems in comparison also arise due to limitations in the scope or coverage of the statistical collections which are the source of the statistics being compiled according to the ASCC. For example, in the lack of detail in the collection of data on non-merchandise trade and poor coverage of ships and aircraft stores; the exclusion from manufacturing census statistics of single establishment enterprises employing less than four persons; lack of statistics on sales of commodities produced by manufacturing establishments on commission for non-manufacturing establishments, and of production of manufactured commodities by non-manufacturing establishments. Where this occurs, production statistics (or trade statistics) could be understated.
- **DIFFERENCES IN QUALITY, ETC.** Difficulties also arise from factors such as differences in quality, material composition, substitutability of commodities, variations in the import component of goods produced in Australia or exported from Australia, etc.

INDUSTRY OF ORIGIN: CLASS 3164: METAL COATING AND FINISHING								
Note: This ASIC industry of origin has been created separately with no ASCC items listed under it because:								
(i) separate, specific, information is not available on the commodities which originate only from industry class 3164 thereby preventing the creation of meaningful and viable standard items for these commodities;								
(ii) the ASCC, at present, relates only to transportable goods, and a major proportion of the activities primary to this industry is involved in the provision of services (e.g. engraving, polishing, plating and heat treatment of metals);								
(iii) the creation of this separate industry of origin category permits the presentation of standardised commodity items for the other important metal industry classes.								
INDUSTRY OF ORIGIN: CLASS 3165: NON-FERROUS STEAM, GAS AND WATER FITTINGS								
3165.00	Tube and pipe fittings and non-ferrous metals, (including fittings for irrigation piping and similar irrigation equipment of iron or steel); taps, cocks, valves and similar appliances of non-ferrous metals, rubber (except unhardened vulcanised rubber) and wood (including parts); taps, cocks and similar appliances (except valves), pneumatically operated control valves and valves of a kind designed for the automatic control of temperature, humidity, pressure, vacuum or rate of flow (including parts), of cast iron; parts for taps, cocks, valves and similar appliances, of iron or steel (except cast iron) (d):	(a) 108,985	31,006	31,066	4,934	4,488	621	5,109
